Trends in smoking and vaping among young people

FINDINGS FROM THE ITC YOUTH SURVEY

DAVID HAMMOND, JESSICA REID, ROBIN BURKHALTER, AND DANIEL HONG, ON BEHALF OF THE ITC YOUTH TOBACCO AND VAPING SURVEY TEAM

APRIL 2023
Foreword

The International Tobacco Control Policy Evaluation Project (ITC) Youth Tobacco and Vaping Survey examines use of tobacco and vaping products among youth in three countries with differing policy environments: Canada, England and the United States. The first national survey was conducted in 2017, with annual waves in subsequent years (and additional semi-annual waves in 2020 and 2021).

The current report summarizes findings among youth respondents aged 16–19 in the three countries, including trends between 2017 and 2022. Additional details are available upon request.

Visit the study website for more information: http://davidhammond.ca/projects/e-cigarettes/itc-youth-tobacco-ecig/.
FUNDING
THE ITC YOUTH TOBACCO AND VAPING SURVEY ANNUAL WAVES 1, 2, 3, 4 AND 6 WERE SUPPORTED BY A P01 GRANT (P01CA200512) FROM THE US NATIONAL INSTITUTES OF HEALTH. WAVES 3.5, 4.5, AND 5 WERE FUNDED BY A CONTRIBUTION FROM HEALTH CANADA’S SUBSTANCE USE AND ADDICTIONS PROGRAM (SUAP). OVERSAMPLES IN SOME US STATES WERE SUPPORTED BY THE ROSWELL PARK COMPREHENSIVE CANCER CENTER AND NATIONAL CANCER INSTITUTE (NCI) (GRANT P30CA016056) AND BY THE ROSWELL PARK ALLIANCE FOUNDATION. OVERSAMPLES IN BC WERE SUPPORTED BY THE BRITISH COLUMBIA MINISTRY OF HEALTH / CANADIAN CANCER SOCIETY. THE VIEWS EXPRESSED HEREIN DO NOT NECESSARILY REPRESENT THE VIEWS OF THE FUNDERS.

ETHICS CLEARANCE
THE PROJECT HAS BEEN REVIEWED BY AND RECEIVED ETHICS CLEARANCE THROUGH A UNIVERSITY OF WATERLOO RESEARCH ETHICS BOARD (ORE#21847/31017) AND THE KING’S COLLEGE LONDON PSYCHIATRY, NURSING & MIDWIFERY RESEARCH ETHICS SUBCOMMITTEE.

Methods

OVERVIEW
The ITC Youth Tobacco and Vaping Survey is a repeat cross-sectional survey conducted annually since 2017 (and semi-annually in 2020 and 2021) in Canada, England, and the United States (US), to examine trends in tobacco use and vaping. This report summarizes key indicators from the surveys in the three countries, with a focus on the 2022 wave.

SAMPLE
Respondents included youth aged 16–19 years, recruited through the Nielsen Consumer Insights Global Panel in all countries. The Nielsen panel is recruited using both probability and non-probability sampling methods in each country. Nielsen selected random samples from the online panel(s) in each country. Recruitment targets at each wave included 4,500 respondents aged 16–19 in each of Canada, England, and the United States. Respondents received remuneration in accordance with their panel’s usual incentive structure. The current report summarizes findings over eight waves between 2017 and 2022.

SURVEY
All data was collected via self-completed online surveys. The survey covers the following content areas:
• prevalence and patterns of smoking and vaping;
• specific products and brands;
• sources and purchasing of cigarettes and vaping products;
• perceptions of risk and social norms around smoking and vaping;
• exposure to health warnings and public education campaigns;
• exposure to e-cigarette marketing;
• awareness and use of other tobacco products;
• substance use and other risk behaviours; and
• socio-demographics and socio-economic status.

DATA ANALYSIS
Post-stratification survey weights were created using age-by-sex-by-region groups, and calibrated to Wave 1 proportions for student status and school grades, as well as the past 30-day smoking trend from national benchmark surveys (in Canada and the US). All estimates in the current report are weighted and rescaled to the original sample size within each country. Estimates are provided with 95% confidence intervals where feasible. Data are summarized within countries over time, as well as across countries within survey waves.

TECHNICAL REPORTS
The surveys and technical reports are available at:
The technical reports include detailed information on methodology and survey weighting.

*NOT INCLUDED ON WAVE 1 SURVEY

NOTE: ADDITIONAL SAMPLE INFORMATION FOR EACH WAVE, INCLUDING COUNTRY-SPECIFIC CATEGORIES FOR RACE/ETHNICITY, AVAILABLE IN THE TECHNICAL REPORTS
Smoking – ‘Ever’

While the majority of youth aged 16–19 in all three countries reported never having smoked a cigarette, prevalence of ever smoking was highest in England in all years. Ever smoking appears to have declined most among youth in the US, down to one in four in 2022.

Caution should be used when interpreting time trends in smoking, since survey weights in Canada and the US have been calibrated to the past 30-day smoking trends observed in national surveys.

Note: Youth survey weights are scaled to the past 30-day smoking trend in Canada (CSTADS) and the US (NYTS).
Smoking – Past 12 months

As with ever smoking, prevalence of smoking in the past 12 months was greatest in England in all years. Time trends in Canada and the US suggest that past 12-month smoking prevalence was fairly stable for several years, dropping somewhat after early 2020 (particularly in the US) and remaining lower since.

Prevalence of smoking in the past 12 months
ALL RESPONDENTS AGED 16-19, 2017-2022
CA: N=34,114; EN: N=32,824; US: N=37,529

NOTE: YOUTH SURVEY WEIGHTS ARE SCALED TO THE PAST 30-DAY SMOKING TREND IN CANADA (CSTADS) AND THE US (NYTS).
Smoking – Past 30 days

Since 2017, past 30-day smoking prevalence has declined very slowly in Canada, but a more pronounced decline was observed in the US. In England, prevalence remained around 15% in most years, but increased to approximately one in five youth in 2022.

As previously noted, survey weights in Canada and the US have been calibrated to the past 30-day smoking trends observed in national surveys of youth.

Prevalence of smoking in the past 30 days
ALL RESPONDENTS AGED 16-19, 2017-2022
CA: N=34,114; EN: N=32,824; US: N=37,529

NOTE: YOUTH SURVEY WEIGHTS ARE SCALED TO THE PAST 30-DAY SMOKING TREND IN CANADA (CSTADS) AND THE US (NYTS).
Smoking – 20+ days per month

A small and declining proportion of youth aged 16–19 in Canada and the US reported smoking on 20 or more of the past 30 days. In England, however, while 2017 prevalence was similar to Canada and the US, it remained slightly above this level for most waves, then appeared to increase in 2022.

Prevalence of smoking ≥20 days in the past 30 days
ALL RESPONDENTS AGED 16–19, 2017–2022

NOTE: YOUTH SURVEY WEIGHTS ARE SCALED TO THE PAST 30-DAY SMOKING TREND IN CANADA (CSTADS) AND THE US (NYTS).
Vaping – ‘Ever’

As with smoking, the majority of youth aged 16–19 in all three countries reported that they had never vaped. Prevalence of ever vaping varied by wave and country. Ever vaping appeared to increase to a peak in the US in 2019 and in Canada in early 2020, before dropping and remaining stable. In England, it appears that ever vaping continues to increase.

Vaping – Past 12 months

Past 12-month vaping prevalence among youth aged 16–19 was similar across countries in most waves. While prevalence in England appeared to lag behind the increases observed in Canada and the US between 2017 and 2019/early 2020, it was comparable through 2021 and appeared to increase sharply in 2022.

**Prevalence of vaping in the past 12 months**
ALL RESPONDENTS AGED 16-19, 2017-2022
CA: N=34,114; EN: N=32,824; US: N=37,529

![Graph showing the prevalence of vaping in the past 12 months for Canada, England, and the US from 2017 to 2022. The graph indicates a steady increase in prevalence for all countries, with a notable increase in 2022.](image-url)
Vaping – Past 30 days

Patterns of past 30-day vaping prevalence among youth aged 16–19 were fairly similar in Canada and the US: increasing from 2017 to a peak in early 2020, subsequently dropping in 2020 before somewhat rebounding. In England, past 30-day vaping prevalence generally increased slowly between 2017 and 2021 before increasing sharply in 2022.

Prevalence of vaping in the past 30 days
ALL RESPONDENTS AGED 16–19, 2017–2022
CA: N=34,114; EN: N=32,824; US: N=37,529
Vaping – 20+ days per month

In 2017, very few youth aged 16-19 (~2%) reported vaping on 20 or more of the past 30 days. In 2022, estimates had risen to 6-8% in all three countries, although the patterns within each country in the intervening years varied: in England, increases were very slow until 2022, while more rapid increases until early 2020 were observed in the US and Canada.

Prevalence of vaping ≥20 days in the past 30 days
ALL RESPONDENTS AGED 16–19, 2017–2022
CA: N=34,114; EN: N=32,824; US: N=37,529
Use of other tobacco products
Canada

In Canada, less than 5% of youth aged 16-19 reported use of each non-cigarette tobacco or nicotine product in the past 30 days. The most popular product in most years since 2017 was cigarillos/little cigars, although waterpipe was comparable or greater until early 2020.

Past 30-day use of other tobacco products
ALL RESPONDENTS AGED 16-19, 2017-2022, CANADA, N=34,114

- Cigarillos/little cigars
- Cigars
- Bidis
- Smokeless tobacco
- Nicotine patches, gum, or lozenges
- Nicotine pouches without tobacco
- Water-pipe to smoke shisha
- Heated tobacco*

ANY COMBUSTED INCLUDES CIGARETTES, CIGARS, CIGARILLOS/LITTLE CIGARS, BIDIS, AND/OR WATERPIPE; ANY NON-COMBUSTED INCLUDES E-CIGARETTES, SMOKELESS TOBACCO, NRT, NICOTINE POUCHES, AND/OR HEATED TOBACCO; ANY TOBACCO/NICOTINE PRODUCT INCLUDES ALL PRODUCTS LISTED

*SURVEY WAVES FROM 2018-2020 ASKED ABOUT IQOS SPECIFICALLY, WHILE WAVES FROM 2021 ON ASKED ABOUT HEATED TOBACCO PRODUCTS GENERALLY
Use of other tobacco products
England

In England, 4–6% of youth aged 16–19 reported use of waterpipe in the past 30 days in most years, apparently peaking in 2019 and early 2020, and dipping in early 2021. Cigarillo/little cigar use was 2% in 2017, but increased steadily, doubling by 2022. Use of other non-cigarette tobacco or nicotine products were less common.

Past 30-day use of other tobacco products
ALL RESPONDENTS AGED 16–19, 2017–2022, ENGLAND, N=32,824

*SURVEY WAVES FROM 2018–2020 ASKED ABOUT IQOS SPECIFICALLY, WHILE WAVES FROM 2021 ON ASKED ABOUT HEATED TOBACCO PRODUCTS GENERALLY
Use of other tobacco products
United States

In the US, cigarillos/little cigars were the most prevalent product reported by youth aged 16-19 in all years, though their use in the past 30 days appeared to generally decline over time. Use of most other non-cigarette tobacco or nicotine products also appeared to decrease over time.

Past 30-day use of other tobacco products
ALL RESPONDENTS AGED 16-19, 2017-2022, US, N=37,529

*CURRENT WAYS FROM 2018-2020 ASKED ABOUT IQOS SPECIFICALLY, WHILE WAVES FROM 2021 ON ASKED ABOUT HEATED TOBACCO PRODUCTS GENERALLY
Use of any tobacco/nicotine products

In 2022, more than one-third of youth aged 16-19 in England reported use of any tobacco or nicotine product in the past 30 days, compared to approximately one in five youth in Canada and the US. Prevalence of using any combusted products among youth in England was more than double that of youth Canada and the US; however, this difference in prevalence was smaller for non-combusted products.

Past 30-day use of any tobacco or nicotine products
ALL RESPONDENTS AGED 16-19, 2022
CA: N=4,395; EN: N=4,283; US: N=4,142

- **Canada**: 22%, 18%

- **US**: 21%, 26%

NOTE: YOUTH SURVEY WEIGHTS ARE SCALED TO THE PAST 30-DAY SMOKING TREND IN CANADA (CSTADS) AND THE US (NYTS).

ANY COMBUSTED INCLUDES CIGARETTES, CIGARS, CIGARILLOS/LITTLE CIGARS, BIDIS, AND/OR WATERPIPE;
ANY NON-COMBUSTED INCLUDES E-CIGARETTES, SMOKELESS TOBACCO, HEATED TOBACCO, NRT, AND/OR NICOTINE POUCHES; ANY TOBACCO/NICOTINE PRODUCT INCLUDES ANY PRODUCTS
Use of any tobacco/nicotine products

Canada

In Canada, prevalence of using combusted tobacco products remained fairly stable over time, decreasing slightly, while use of any tobacco or nicotine products appeared to vary with the use of non-combusted products. The use of non-combusted products doubled between 2017 and 2019 before dipping in late 2020 and then rebounding in subsequent waves.

Past 30-day use of any tobacco or nicotine products

All respondents aged 16-19, 2017-2022, Canada, N=34,114

- Any tobacco or nicotine products
- Any combusted tobacco products
- Any non-combusted tobacco products

Note: Youth survey weights are scaled to the past 30-day smoking trend in Canada (CSTADS) and the US (NYTS).

Any combusted includes cigarettes, cigars, cigarillos/little cigars, bidis, and/or waterpipe; any non-combusted includes e-cigarettes, smokeless tobacco, heated tobacco, NRT, and/or nicotine pouches; any tobacco/nicotine product includes any products.
Use of any tobacco/nicotine products

England

In England, use of both combusted and non-combusted tobacco products increased between 2017 and 2022, with the largest increases occurring in the most recent waves. Over time, while use of combusted tobacco products accounted for most of the total prevalence of tobacco use, non-combusted products increased more readily, equaling combusted products by late 2021.

Smoking status among vapers

In 2022, the majority of past 30-day vapers in each country were experimental smokers. The proportion who were current smokers varied widely, from 3% in the US to 11% in Canada to 23% in England; few were former smokers. Approximately one-third of past 30-day vapers in the US, and slightly fewer in Canada, had never smoked cigarettes, compared to one in five in England.

Roll-your-own tobacco

Among past 30-day smokers aged 16-19, the majority mainly or only used factory-made cigarettes; this was most common in Canada, at four out of five smokers. Roll-your-own tobacco was more popular in England than other countries, with nearly one in five youth smokers reporting they mainly or only used roll-your-own.

Do you smoke factory-made cigarettes, roll-your-own cigarettes, or both?
PAST 30-DAY SMOKERS AGED 16-19, 2022
CA: N=411; EN: N=944; US: N=316

*HIGH VARIABILITY OF ESTIMATE (CV>0.33)
Use of menthol-flavoured cigarettes

Youth who smoked in the past 30 days were asked if their usual variety of cigarettes or tobacco was menthol- or mint-flavoured. In 2022, approximately half of youth smokers in the US reported usually smoking a menthol brand, nearly double the proportions in Canada and England, where menthol cigarettes are prohibited.

‘Menthol’ cigarettes include factory-made or roll-your-own cigarettes (including from illicit or alternate sources), may be flavoured using menthol accessories (such as flavour cards, filters, capsules), or may be ‘alternative’ brands perceived as menthol.

Is the variety of cigarettes or roll-your-own tobacco you currently smoke most often flavoured to taste like menthol or mint?

% ‘YES’, PAST 30-DAY SMOKERS AGED 16-19, 2020-2022
CA: N=1,441; EN: N=2,879; US: N=1,558

'DON'T KNOW' AND 'REFUSED' RESPONSES ARE EXCLUDED FROM DENOMINATOR
Use of menthol-flavoured cigarettes

Youth smokers were also asked if any of the cigarettes they had smoked in the past 30 days were flavoured to taste like menthol or mint, or had a filter with a flavour capsule. In 2022, the majority of past 30-day smokers in the US reported having smoked menthol or flavour capsule cigarettes, compared to one-third in Canada and slightly more in England, where menthol cigarettes are prohibited.

**Smoked any menthol or capsule cigarettes in past 30 days**

“HOW MUCH NICOTINE DO THE E-CIGARETTES, CARTRIDGES, PODS, OR E-LIQUIDS YOU CURRENTLY USE CONTAIN?” [RESPONSE RANGES IN MG/ML OR %; I DON’T KNOW; REFUSED], ASKED OF PAST 30-DAY VAPERS WHO USUALLY USED NICOTINE; CONCENTRATION REPORTED AMONG ALL PAST 30-DAY VAPERS [INCLUDING THOSE WHO DID NOT USE NICOTINE (OR DID NOT KNOW)]; REFUSED EXCLUDED FROM DENOMINATOR
Nicotine in vaping products

In Canada, the proportion of youth vapers who reported using products with a nicotine concentration higher than 20mg/mL was near half prior to the July 2021 implementation of the federal *Nicotine Concentration in Vaping Products Regulations*, which set a maximum nicotine concentration of 20 mg/mL for vaping products. After the implementation of the limit, this proportion decreased to near one-third in August 2021, and just one in four in 2022. No major changes over time were observed in England or the US, although England, which also limited nicotine concentration limit to 20 mg/mL, consistently had a low prevalence of use above this level.

**Nicotine concentration >2% / 20mg/mL**

Nicotine in vaping products

Among past 30–day vapers, the proportion who reported usually using a product that contained nicotine salts increased in Canada and the US between 2018 and early 2020, and since then levels have decreased only slightly. In England, fewer youth vapers reported using nicotine salts in 2018, but this proportion increased steadily until early 2021 before levelling off at a rate similar to the US.

E-cigarette education – sources
Canada

Since 2018, school and social media have been the most commonly reported places that Canadian youth noticed education campaigns or messages about vaping; after peaking in early 2020, prevalence of noticing in these sources has been fairly stable in the most recent waves.

Exposure to education or health messages about vaping
% ‘YES’ IN PAST 12 MONTHS, CANADA, 2018–2022 N=29,894

“In the past 12 months, have you noticed education campaigns or public health messages about e-cigarettes/vaping in any of the following places?” [YES/NO FOR EACH SOURCE]; REFUSED EXCLUDED FROM DENOMINATOR
School and social media were also the most commonly reported places that youth in England noticed education campaigns or messages about vaping, though at lower levels than in Canada. There was little change over time in noticing through many sources.

E-cigarette education – sources
United States

In the US, websites/social media, school and TV or radio have been the most commonly reported places that youth noticed education campaigns or messages about vaping; noticing in these sources increased steeply up to 2020 and has remained high since then, with websites/social media increasing even further, to over half.

Exposure to education or health messages about vaping
% ‘YES’ IN PAST 12 MONTHS, US, 2018–2022 N=33,157

“In the past 12 months, have you noticed education campaigns or public health messages about e-cigarettes/vaping in any of the following places?” [YES/NO FOR EACH SOURCE]; REFUSED EXCLUDED FROM DENOMINATOR
Noticing e-cigarette warnings

In 2022, among all respondents, more youth in the US than Canada or England reported noticing health warnings on e-cigarette packaging, on advertisements, in stores and on websites that sell e-cigarettes. Among past 30-day vapers, proportions noticing in each source were greater; fewer vapers in England reported noticing warnings.

"HOW LONG DO YOU THINK SOMEONE HAS TO USE E-CIGARETTES/VAPE BEFORE IT HARMs THEIR HEALTH?"; REFUSED EXCLUDED FROM DENOMINATOR
Perceptions of risk
Harm relative to cigarettes

When respondents were asked about the relative harm of e-cigarettes compared with “regular” tobacco cigarettes, over half of youth in England, nearly 40% in Canada and one-third in the US correctly responded that e-cigarettes were less harmful (either ‘a little’ or ‘a lot’). Nearly one-third of youth in Canada and the US, and about one in five in England, thought they were ‘as harmful’. Relatively few youth thought that e-cigarettes were more harmful than tobacco cigarettes.

Is using e-cigarettes/vaping less harmful, about the same, or more harmful than smoking cigarettes?

*than ‘regular’ tobacco cigarettes
Perceptions of risk
Addictiveness relative to cigarettes

When respondents were asked about the relative addictiveness of e-cigarettes compared with “regular” tobacco cigarettes, the largest proportion in each country thought they were ‘as addictive’. Somewhat more youth in England responded that e-cigarettes were less addictive, but country differences were generally not pronounced.

Is using e-cigarettes/vaping less addictive, about the same, or more addictive than smoking cigarettes?

*than ‘regular’ tobacco cigarettes
Perceptions of risk
Harm of addiction

When respondents were asked about their perceptions of addiction to vaping, most thought that addiction was harmful on its own, even if it doesn’t cause physical health problems. More youth in Canada and the US selected ‘yes, a lot’, while more youth in England selected ‘yes, a little’.

Do you think addiction to e-cigarettes/vaping is harmful on its own, even if it doesn’t cause physical health problems?

Intentions to quit e-cigarettes

Past 30-day vapers aged 16-19 were asked about their plans to quit. In 2022, approximately one-quarter of vapers in each country reported planning to quit within the next 6 months, and similar proportions indicated that they had no plans to quit vaping.

Are you planning to quit using e-cigarettes/vaping . . .

Attempts to quit e-cigarettes

Approximately half of past 30-day vapers aged 16-19 in Canada and the US, and slightly fewer in England, reported ever trying to quit. Within each country, somewhat fewer reported trying to quit vaping in the past year.

Have you ever tried to completely stop vaping?

US: 38%
Reasons for quitting e-cigarettes

Respondents with recent quitting experience were asked about reasons they quit, tried to quit, or did not continue vaping. In 2022, the most commonly selected reason in all three countries was just trying vaping, followed by concern about health risks. Many reasons were selected by fewer respondents in England, although smoking-related reasons were selected by more respondents in England.

"WHICH OF THE FOLLOWING ARE REASONS YOU [TRIED TO STOP USING/STOPPED USING/DID NOT CONTINUE] USING E-CIGARETTES/VAPING [IN THE LAST 12 MONTHS]?", WORDING DEPENDS ON VAPING STATUS; TRY IN LAST 12 MONTHS ASKED OF PAST 30-DAY VAPERS WHO TRIED TO QUIT IN PAST 12 MONTHS, STOPPED IN PAST 12 MONTHS AMONG PAST-YEAR VAPERS WHO DID NOT USE IN PAST 30 DAYS, DID NOT CONTINUE AMONG EVER USERS WHO DID NOT USE IN PAST 12 MONTHS; REFUSED EXCLUDED FROM DENOMINATOR
Alcohol use

The proportion of youth who reported drinking alcohol at least monthly in the past 12 months varied substantially by country. Prevalence was highest in England, where over half of youth reported drinking in 2017, declining over time to near 40%. In Canada, monthly drinking was reported by nearly one-third of youth in 2022, down slightly from 2017. Prevalence was much lower in the US, at nearly one in five in 2017, and down to 15% in 2022.

Alcohol use – monthly in the past 12 months

Cannabis use

Among youth aged 16–19, more youth in Canada and the US reported using cannabis in the past 30 days than in England. Cannabis prevalence was very similar in Canada and the US over time: past 30-day use increased from 2017 to early 2020, then dropped slightly in 2020 and remained fairly stable. Prevalence in England was steady over time at about one in ten youth, except for a small bump in early 2020.
